OUR COMMITMENT TO OUR COMMUNITY

Dear Customers,

Over the past few years, we have faced some extraordinary challenges with COVID-19. This past year, I am proud to report that we were able to continue to meet our commitments to the health and safety of our employees, customers, and our community. To meet those commitments, we made modifications to our procedures and learned how to adjust our operations to meet stakeholders’ needs impacted by the epidemic. We focused on our mission and provided the best service possible under these circumstances. Many of our adjustments required our customers and community to change the way they conducted business with our Utility. Those efforts did not go unnoticed, and we would like to thank everyone for their part in accommodating the necessary changes required to meet our goals. Moreover, thank you for your patience, understanding and continued support during these times.

As the world continues to get back to normal, we will remain vigilant. Golden Heart Utilities, Inc. (GHU) will strive for continual improvement and take all reasonable and appropriate science based-actions required to mitigate the impacts of COVID-19 on our employees, customers, and our community. In addition, we will closely monitor guidance provided by the CDC, the World Health Organization, and our state and local public health agencies and make decisions accordingly.

Presently, we are faced with a lot of uncertainty in the world. Together we can face any challenges ahead and with the steadfast support from the community we will continue to succeed!

If you have further questions, please contact us at 907-479-3118 or usainfo@akwater.com.

Sincerely,

Oran Paul
President
DRINKING WATER QUALITY REPORT

Golden Heart Utilities, Inc. (GHU) is proud of the fine drinking water we provide and are happy to report to you that we have met or surpassed established water quality standards.

This annual water quality report describes the source of our water, lists the results of our 2021 tests, and contains important information about water and health.

Benefits of Chlorination

Disinfection, a chemical process used to control disease causing microorganisms by killing or inactivating them, is unquestionably the most important step in drinking water treatment.

Before communities began routinely treating drinking water with chlorine, starting with Chicago and Jersey City in 1908, cholera, typhoid fever, dysentery, and hepatitis killed thousands of U.S. residents annually.

Drinking water chlorination and filtration have helped to virtually eliminate these diseases in the United States. Significant strides in public health are directly linked to the adoption of drinking water chlorination. In fact, the filtration of drinking water plus the use of chlorine is probably the most significant public health advancement in human history.

Where Our Water Comes From

We operate four wells, 80 to 90 feet deep, which pump an average of 3.2 million gallons per day. These wells tap the huge aquifer that lies beneath the Tanana Valley.

Water Testing and Your Health

To ensure that tap water is safe to drink, the U.S. Environmental Protection Agency (EPA) prescribes limits on the amount of certain contaminants in water provided by public water systems. Similarly, the Food Drug Administration (FDA) regulates bottled drinking water.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA’s Safe Drinking Water Hotline 1-800-426-4791.

(continued on page 4)
Water Testing and Your Health

(continued from page 3)

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in source water include:

- Microbiological contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban storm runoff, industrial or domestic wastewater discharges, oil and gas production, mining or farming.
- Pesticides and herbicides, which may come from a variety of sources such as agriculture, stormwater runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organics, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, and septic systems.
- Radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities.

Consumers With Special Health Concerns

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers.

EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline 800-426-4791.

Source Water Assessment

The Alaska Department of Environmental Conservation (ADEC) Source Water Assessment program was implemented to make public water systems and the public they serve aware of potential wellhead and watershed contamination sources. An informed public is the best ally in wellhead and watershed protection. GHU's most recent source water assessment identified possible contaminating activities (PCAs) located in the Fairbanks area. PCAs at the top of GHU's source water (well water) vulnerability ranking include: industrial activities, businesses, fuel storage tanks, sewer lines, residential areas, landfill, airport, class V injection wells, and ADEC recognized contaminated sites. Due to the PCAs in our area, the Fairbanks aquifer received a high to very high vulnerability ranking. Despite the high vulnerability ranking, **GHU’s water quality remains stable and EPA compliant.** If contaminant levels above the allowable limits are ever detected in the source and/or distribution water, you will receive notification of the results.

Some of the contaminants that could be found in our source water are removed during the water treatment process prior to distribution. GHU performs numerous required tests on the water it provides to its customers. Regular monitoring of the source wells, treatment process, and the distribution system helps to ensure water quality.

In addition to ADEC and EPA required testing, GHU takes added samples from the distribution system and the source wells to help ensure the safety of the water we supply to our customers. This sampling includes general water quality tests such as pH, total dissolved solids, conductivity, turbidity, hardness, alkalinity, salinity, and bacteriological analysis. The weekly water quality tests and quarterly volatile organic chemical samples are meant to alert GHU to the presence of source water contamination.

If each of us does our part to protect our water resources, we can ensure that future generations will have ample supplies of high-quality water. A complete copy of the source water assessment document can be obtained by contacting Golden Heart Utilities' customer service department at 907-479-3118.
Testing Our Water
The ADEC and US EPA require GHU to test the drinking water we distribute regularly to make sure that it meets State and Federal requirements.

GHU collects numerous water samples from locations throughout the community to monitor the quality of water as it travels to your tap.

The Detected Contaminant Table on page six shows substances that are regulated by the US EPA and ADEC and that were detected in our finished drinking water. GHU tests for many other substances, but because they were not detected, they are not reported here.

The State requires GHU to monitor for certain contaminants less than once a year because concentrations of these contaminants are not expected to vary significantly from year to year.

**HOW TO READ THE WATER QUALITY TABLES**

**AL**
Action Level or the concentration which, if exceeded, triggers treatment or other requirements which a water system must follow.

**MCL**
Maximum Contaminant Level or the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

**MCLG**
Maximum Contaminant Level Goal or the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

**MRDL**
Maximum Residual Disinfectant Level or the highest level of a disinfectant allowed in the distribution system.

**MRDLG**
Maximum Residual Disinfectant Level Goal or the level of a disinfectant in the distribution system below which there is no known or expected risk to health. MRDLGs allow for a margin of safety.

**NA**
Not applicable.

**NTU**
A Nephelometric Turbidity Unit is a measure of the clarity of water. Turbidity in excess of 5 NTU is just noticeable to the average person.

**ppb**
Parts per billion, or micrograms per liter (µg/L). The same as one minute in 2,000 years or one penny in $10,000,000.

**ppm**
Parts per million, or milligrams per liter (mg/L). The same as one minute in two years or one penny in $10,000.

**pCi/L**
Picocuries per liter (a measure of radioactivity).

**ppt**
Parts per trillion or nanograms per liter (ng/L). The same as one minute in 32,000 years.

The “<” symbol
A symbol which means ‘less than’. A result of “< 2.0” means that the contaminant was not detected above the reportable level of 2.0.

</table>

Data in this report is from the most recent testing done in accordance with regulations and presented as required by 40 CFR 141.153 and 141.154.

\(^1\) The addition of fluoride was halted on 6/15/2011 by City Ordinance No. 5849.

\(^2\) Reported as the highest locational running annual average.

\(^3\) Reported as the highest system-wide running annual average.

\(^4\) Our water system has sampled for a series of unregulated contaminants. Unregulated contaminants are those that don’t yet have a drinking water standard set by the EPA. The purpose of monitoring for these contaminants is to help the EPA decide whether the contaminants should have a standard.

\(^5\) Detected PFAS: perfluorohexanesulfonic acid (PFHxS), perfluorohexanoic acid (PFHxA); perfluorooctane sulfonate (PFOS), perfluorooctanoic acid (PFOA)

\(^6\) Not applicable at this time, the EPA is currently studying PFAS to determine whether MCLG and MCL are needed.

\(^7\) The EPA’s lifetime health advisory level (LHAL) for PFOA and PFOS offers a margin of protection for all Americans throughout their life from adverse health effects resulting from exposure to PFOA and PFOS in drinking water.
OTHER MONITORING

In addition to the ADEC and EPA mandated sampling, our water system voluntarily tests for numerous additional substances to make certain your water is of the highest quality.

Additional Information About Lead in Drinking Water

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing.

Golden Heart Utilities is responsible for providing high quality drinking water but cannot control the variety of materials used in household plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to two minutes before using water for drinking or cooking.

If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline 1-800-426-4791 or at: www.epa.gov/safewater/lead.

Water that remains stationary within your home plumbing for extended periods of time can leach lead out of pipes joined with lead-containing solder as well as brass fixtures or galvanized pipes. Flushing fixtures has been found to be an effective means of reducing lead levels. The flushing process could take from 30 seconds to 2 minutes or longer until it becomes cold or reaches a steady temperature. Flushing times can vary based on the length and materials of your service line (the pipe connecting your home to the water main) and the plumbing configuration in your home. For example, if your home is set back far from the street or in an apartment complex, a longer flushing time may be needed to lower lead levels. If you have a lead service line, run the water for three to five minutes (or longer if instructed to do so by your water provider) to reduce the potential lead exposure from the water. Please note that flushing may not be effective in high-rise buildings. Faucets, fittings, and valves, including those advertised as “lead-free,” may contribute lead to drinking water. Consumers should be aware of this when choosing fixtures and take appropriate precautions. Visit the NSF Web site at www.nsf.org to learn more about lead-containing plumbing fixtures.

Attention Property Owners and Managers

This report is available at our administrative office located at 3691 Cameron Street or on our website at: http://www.akwater.com/ghu-CCR.pdf

Certain residents and tenants may not receive notice of this report if the property owner or manager is receiving the water bill. While not required by law, property owners and managers, as well as business owners, are encouraged to provide this information to their tenants. This report should be photocopied and distributed or posted in a prominent place at the facility.
What are PFOA and PFOS?
PFOA and PFOS are perfluoroalkyl substances (PFAS) – man-made chemicals that are resistant to oil, stains, grease, and water. They have been used to make carpets, fabrics for clothing and furniture, paper packaging for food, non-stick cookware, and firefighting foams. PFOS and PFOA are no longer manufactured in the United States.

How can I be exposed to PFAS?
PFAS have been used worldwide in industry and consumer products since the 1940s; they are released into the environment (air, water, soil, etc.) when other products are made, used, or discarded. PFAS are very stable and persist in the environment for long periods of time. People can be exposed to these chemicals in house dust, indoor and outdoor air, food, and drinking water. Because PFAS were used worldwide, stay in the environment for a long time, and travel long distances in water and air, there are trace amounts all around us.

What is an advisory level?
A lifetime health advisory level (LHAL) is the amount below which no harm is expected from these chemicals. EPA’s lifetime health advisories identify levels to protect all people, including sensitive populations and life stages, from adverse health effects resulting from exposure throughout their lives to these PFAS in drinking water.

The EPA has set LHALs for PFOA and PFOS. PFOA = 0.004 (ppt) PFOS = 0.02 (ppt).
